

U.S. Marine Recreational Fisheries

DATA COLLECTION. Detailed information on marine recreational fishing is required to support a variety of fishery management and development purposes and is mandated by the Sustainable Fisheries Act, Public Law 94-265. In 1979, NMFS began the comprehensive Marine Recreational Fisheries Statistics Survey (MRFSS), covering all fishing modes (private/rental boat, party/charter boat, and shore), and including estuarine and brackish water. Although the recreational harvest is only about 8 percent of the total U.S. harvest of finfish for states covered by the MRFSS (see coverage section below), the fishing activities of millions of marine anglers are important to monitor because they are directed at relatively few species. Data collected through the MRFSS and other programs show that recreational fishing significantly impacts the stocks of many marine finfish species. Recreational catches even surpass commercial landings of some species (see figure on preceding page).

METHODS. The MRFSS consists of a telephone survey of coastal county households and a field intercept survey of angler fishing trips. The telephone survey collects data on the number of marine recreational fishing trips by residents of coastal counties. The intercept survey collects data on the proportion of fishing trips by residents of non-coastal counties, the species composition of catches, catch rates by species, and lengths and weights of landed fish. These data are combined to produce estimates of catch and effort. Catch estimates are separated into two categories - harvested catch and catch released alive. Harvested catch includes landed fish and catch reported as dead. Whenever possible MRFSS field interviewers identify, count, weigh, and measure landed fish that are available in whole form (catch type A). Angler reports are obtained for catch released alive (catch type B2) and for all other harvested catch (catch type B1), such as catch released dead, used for bait, or filleted fish. Catch estimates are stratified by subregion, state, wave (bimonthly sampling period), species, fishing mode (private/rental boat, party/charter boat, and shore), primary area fished, and catch type. In addition, economic data are obtained and estimates of participation are produced.

In place of the MRFSS, Oregon and Washington conduct ocean boats surveys to produce catch and effort estimates. Oregon's Ocean Recreational Boat Survey (ORBS) and Washington's Ocean Sampling Program (OSP) consist of a field intercept survey for effort and

catch of passenger and private boats. The effort data consist of censuses of boat trips from a particular ocean port inlet on sampled days. The catch data consist of fish species composition from sampled boats, numbers of anglers, type of fishing, lengths and weights of landed catch, and tag information from marked fish. Catch landed whole are examined by samplers, while other catch is reported by anglers or passenger boat crew. Other catch includes fillets and released fish. The catch rate data and boat counts are combined and expanded by type of day to produce catch and effort estimates in weekly to monthly time periods. Estimates of mean catch per boat, catch per angler, total angler trips and boat trips are produced for each port inlet or port group stratified by time period, type of boat, type of trip and water area. Catch estimates in numbers of fish and weight are produced for each species of fish with tag contribution rates for marked fish species.

On the Atlantic and Gulf coasts, and in California and Washington's Puget Sound, effort for the party/charter fishing mode is now estimated through For-Hire Surveys (FHS). These surveys differ from the MRFSS because they use a telephone survey of boats, rather than households, as the primary method for estimating fishing effort. The telephone surveys are weekly surveys that use a directory of charter boats and/or party/headboats as their sampling frame. Samples of boats are selected at random, and the operators of those boats are contacted for telephone interviews to collect information on the number of boat trips and the numbers of anglers who fished. The telephone surveys estimate the number of trips by boats included in the sampling frames. A dockside survey of boat slips is used to validate the phone-reported effort data and estimate appropriate corrections for any reporting errors. Dockside and on-board intercept surveys collect the angler trip and catch data. The total catch of any one species is calculated as the product of the adjusted estimate of total angler trips and the estimated mean catch per trip. Although separate estimates are generated for charter boat and party/headboat fishing through the FHS, estimates are not stratified by vessel type in California or Puget Sound. This improved effort methodology was initiated in 2000 on the Gulf coast, in 2001 on the Pacific coast, and in 2003 on the Atlantic coast. FHS numbers are included here for the Gulf coast and California but not for the Atlantic coast or Puget Sound.

U.S. Marine Recreational Fisheries

COVERAGE. In 2004, the MRFSS included the Atlantic coast (Maine-East Florida), Gulf coast (Louisiana-West Florida), Puerto Rico and Hawaii. Detailed information and access to the data are available on the Fisheries Statistics web page (<http://www.st.nmfs.gov/st1/recreational/>). Care is advised when comparing catch estimates for the MRFSS time series because of differences in sampling coverage.

In the South Atlantic and Gulf sub-regions (NC-LA) the MRFSS has not collected catch data from head boats since 1985, so estimates for these sub-regions now only include charter boats in the for-hire sector. Marine recreational fishing in Texas is monitored by the Texas Department of Parks and Wildlife and has not been surveyed by the MRFSS since 1985. Prior to 1998, on the Pacific coast, ocean boat trips and salmon trips were not sampled during certain waves because they were surveyed by state natural resource agencies. Alaska conducts an annual mail survey and has never been surveyed by the MRFSS. West Pacific U.S. territories have not been surveyed by the MRFSS since 1981. Hawaii was not surveyed between 1981 and 2001. The U.S. Caribbean was not surveyed between 1981 and 2000.

Historically, only about five percent of the annual recreational catch on the Atlantic and Gulf coasts is taken during Wave 1 (January - February). Costs to sample these months are very high due to low fishing activity. Therefore, in Jan/Feb of 1981 the MRFSS was not conducted in any region. In 1982, Jan/Feb data collection resumed on the Pacific and Gulf coasts and also on the Atlantic coast of Florida. With a few exceptions (Georgia 1985-1989, South Carolina 1988, North Carolina 1988-1992), the MRFSS has not been conducted in Jan/Feb on the Atlantic coast north of Florida since 1980.

Time periods when the MRFSS has not been conducted:

Nov/Dec (Maine and New Hampshire) - 1987 to present; Mar/Apr (Maine and New Hampshire) - 1986 to present; Jan/Feb (Northern California and Oregon) - 1994; Jan/Feb (Southern California and Oregon) - 1995; Nov/Dec (Oregon) - 1994; Nov/Dec (Washington shore modes) - 2003; July - Dec (Oregon shore modes) - 2003; All Waves (California through Washington) - 1990 to 1993, 2004 to present; All Waves (Washington) - 1993 to 1994.

Data from other NMFS and state surveys (e.g. southeast head boats, Texas, California Passenger Fishing Vessels, Pacific salmon, Alaska) are not included in this report.

DATA TABLES. The estimated harvests (numbers and weight of fish) for the continental U.S. and Hawaii (excluding Texas) are presented. Numbers of fish harvested and released alive are also presented for many important species groups. Estimated harvests are presented by subregion and primary fishing area: inland [sounds, rivers, bays], state territorial seas [ocean to 3 miles from shore, except for Florida's Gulf coast and Puerto Rico, where state territorial seas extend to 10 miles from shore], and Exclusive Economic Zone (EEZ) [ocean from the outer edge of the state territorial seas to 200 miles from shore]. The total numbers of estimated trips and participants are presented by state.

2004 MRFSS DATA. In 2004, about 14 million anglers made almost 82 million marine recreational fishing trips to the Atlantic, Gulf and Pacific coasts. The estimated total marine recreational catch was 441 million fish, of which over 55 percent were released alive. The estimated total weight of harvested catch was 254 million pounds. The Atlantic coast accounted for the majority of trips (60 percent) and catch (52 percent). The Gulf coast (excluding Texas, see MRFSS coverage page) accounted for 30 percent of trips, and 43 percent of the catch. The Pacific coast accounted for 6 percent of trips, and 4 percent of the catch. Nationally, most (56 percent in numbers of fish) of the recreational catch came from inland waters, 32 percent from state territorial seas, and 12 percent from the EEZ. The majority of Atlantic, Gulf and Pacific trips fished primarily in inland waters

ATLANTIC. In 2004, over 6.4 million residents participated in marine recreational fishing. All participants, including visitors, took over 48 million trips and caught a total of more than 229 million fish. Twenty-two percent of the trips were made in east Florida, followed by 15 percent in North Carolina, 14 percent in New Jersey, 9 percent in New York, 9 percent in Massachusetts, 7 percent in Virginia, and 6 percent in Maryland. Together, Connecticut, Rhode Island, and South Carolina accounted for 11 percent of the trips, and Delaware, Maine, Georgia, and New Hampshire accounted for the remaining percentage. The most commonly caught non-bait species (in numbers of fish) were Atlantic croaker, summer flounder, striped bass, bluefish, and spot. The largest harvests by weight were striped bass, bluefish, summer flounder, Atlantic croaker and dolphinfish.

U.S. Marine Recreational Fisheries

The total annual catch of striped bass increased steadily from 10.8 million fish in 1995 to 17.5 million fish in 1997. After increasing from 14.1 million fish in 1999 to nearly 19 million fish in 2000, striped bass catch declined slightly to 15.6 million fish in 2001 and 2002, increased to 17.3 million fish in 2003, and then to 19.8 million fish in 2004. Over 87 percent of the striped bass caught in 2004 were released alive. Annual summer flounder catch decreased from 28 million fish in 2001 to 16.7 million fish in 2002, and remained steady at 20.6 million fish in 2003 and 2004. Over 77% of the summer flounder caught in 2004 were released alive. Bluefish catch has varied between 9.2 million fish (1998) and 20.4 million fish (2001), fell to 15 million fish in 2003, but increased again to 18.7 million fish in 2004. Black sea bass catch, which has varied between 6.3 and 19 million fish from 1995 through 2000, remained steady at 16.2 million fish in 2001 and 2002, but declined to 10.8 million fish in 2004.

The species most commonly caught on Atlantic coast trips that fished primarily in federally managed waters were black sea bass, Atlantic cod, bluefish, summer flounder, and dolphinfish. Thirty percent of the total Atlantic catch came from saltwater trips that fished primarily in the state territorial seas, and 57 percent came from trips that fished primarily in inland waters.

GULF OF MEXICO. In 2004, 3.6 million residents participated in marine recreational fishing. All participants, including visitors, took over 24 million trips and caught over 187 million fish (excluding Texas). About 68 percent of the trips were made in west Florida, followed by 20 percent in Louisiana, 8 percent in Alabama, and 4 percent in Mississippi. The most commonly caught non-bait species (numbers of fish) were spotted seatrout, red drum, white grunt, sheepshead, and gray snapper. The largest harvests by weight were for red drum, spotted seatrout, sheepshead, red snapper, Spanish mackerel, and king mackerel.

Red snapper catch has varied over the last ten years between 1.5 (1995) and 3.2 (1999 and 2002) million fish, with a total catch of over 3.1 million fish in 2004. King mackerel catch has varied between 750,000 (1996) and 420,000 (1999) over the last ten years, with total catch at 447,000 fish in 2004. Spotted seatrout catch has varied between 18 million fish and 29 million fish over the last ten years, with a catch of just over 29 million fish in 2004. Red drum catch varied over the last ten years between 6.1 million fish (1996 and 1999) and 8.7 million fish (2000), reaching 8.4 million fish in 2004.

The species most commonly caught on Gulf of Mexico trips that fished primarily in federally managed waters were white grunt, red snapper and black sea bass. Twenty-eight percent of the total Gulf catch came from trips that fished primarily in the state territorial seas, and 61 percent came from trips that fished primarily in inland waters.

PACIFIC. In 2004, about 4 million in-state marine recreational fishing participants took over 4.8 million trips and caught a total of 18 million fish. Ninety-one percent of the trips were made in CA, followed by 5 percent in OR, and 4 percent in WA. The most commonly caught non-bait species (in numbers of fish) were barred sand bass, Pacific bonito, kelp bass, black rockfish, coho salmon, and Pacific barracuda. By weight, the largest harvests were Chinook salmon, coho salmon, black rockfish, barred sand bass, Pacific barracuda, and albacore.

Total annual catch of lingcod has varied between 240,000 fish (1995) and 1.2 million fish (2002) over the last ten years, but decreased to 323,000 fish in 2004. Total black rockfish catch, which has varied between 595,000 (1997) and 1.4 million (2000) fish over the last ten years, decreased to 700,000 fish in 2004.

The most commonly caught Pacific coast species in federally managed waters were barred sand bass, Pacific sanddab, kelp bass, California scorpionfish, and Chinook salmon. Eighty-two percent of the total Pacific catch came from trips that fished primarily in the state territorial seas, and 10 percent came from trips that fished primarily in inland waters.

PUERTO RICO. In 2004, about 167,000 marine recreational participants took 1.1 million trips and caught a total of about 1.1 million fish. The most commonly caught non-bait species (in numbers of fish) were dolphinfish, coney, blue runner, silk snapper and cero. By weight, the largest harvests were dolphinfish, blackfin tuna, skipjack tuna, yellowfin tuna, mutton snapper, and great barracuda.

HAWAII. In 2004, more than 407,000 marine recreational participants took 2.9 million trips and caught a total of about 4.5 million fish. The most commonly caught non-bait species (in numbers of fish) were yellowstripe goatfish, skipjack tuna, yellowfin tuna, bluefin trevally, and dolphinfish. By weight, the largest harvests were yellowfin tuna, dolphinfish, skipjack tuna, wahoo, and blue marlin.
